WOODS HOLE, MASSACHUSETTS

July 29, 1957.

Dear Joshua,

One of the students here would like to do electron microscopy on protoplasts, preferably growing as microcolonies in the depths of agar rather than centrifuged from liquid medium. I understand you've succeeded in getting colonies of protoplasts of E. coli on agar + broth + penicillin. We didn't ~~with~~ succeed with yeast extract + casein hydrolysate instead of broth. Do you have any advice that might help her?

I presume we won't see you here this summer. Have a nice trip to Australia.

The dates (revised) of your genetics meeting at Madison are O.K.

Best to Esther, Bernie

P.S.: I have to be in N.Y. the day before your Harvey Lect. in Dec., so I may stay over for it. Would be glad to lend you my monkey suit (I know you abhor them) if you want to try to fit yourself to it.
