Epoxide hydratase

This is probably familiar to you. But it just occurred to me that the differential induction of P450 s/ accompanying hydratase would cause the most troublesome accumulation of intermediates. I assume that the diols are relatively innocuous compared to the epoxides; but do not know of empirical validation.

Have you measured induction of hydratase in your own work?

P.S. - Please think who would be a good teammate for A J Conney.
