WOODS HOLE, MASS.

June 28

Dear Josh and Esther,

I'd like you to know how much I enjoyed staying with you in Madison. It was especially good to meet Novick and Bob Sachs.

Our research mill is grinding steadily here, and I am getting around to looking for specific or preferential effects of presumed mutagens which would show up as restriction of the homology pattern. Sounds a little screwball, doesn't it?

After several trials I am forced to conclude that nitrogen mustard produces no lethal mutations detectable by the heterokaryon method. I have no explanation for this fantastic finding, but it is food for thought.

Barbee, BJ, and Janie send their regards.

Yours,

Kim
