R. J. ANDERSON
PROFESSOR OF CHEMISTRY
STERLING CHEMISTRY LABORATORY
225 PROSPECT STREET

March 21, 1931.

Dear Doctor Sabin:

I have just succeeded in separating Phthioic acid into optical antipodes, that is, into dextro- and levorotatory fractions. The dextro and the levo acids may have different biological effects. I am wondering if you would have time to try a few animal experiments on these new products? I have not yet had time to analyze my preparations, having just made the final separation today, but I am so anxious to know what these acids will do on cell stimulation that I am hoping we can do the biological and chemical analyses simultaneously.

Very sincerely
Rudolph J. Anderson

P.S.
I hope to have the material ready for you same time next week.
