Dear Josh, 11/30/49

Since I was working with 680, Y-10, Y-53 etc, I looked to see where T3 sensitivity appeared in this series. I plated 100 T3's on K-12, 680, Y-10, Y-53, W-1 and B. I got no plaques on K-12 and 680. I found 100 on all the rest.

I seem to recall that we once had reason to think that this T3 sensitivity was not allelic with B_1. I don't think I'll repeat it, but it would be nice to see whether two distinct mutations occurred when 680 → Y-10.

Perhaps the phage sensitivity is due to Y-10 etc being λ^-.

Incidentally I find that the difference in PhtR between K-12 and W-1 is not due to the fact that I grew the K-12 in minimal medium and the W-1 in minimal + B_1 + T + L.

Szilard has come back but I have hardly seen him.

Aaron
