Memo from *To:* Yehudit

JOSHUA LEDERBERG

DEC 22 1975

I just ran into this note. It suggests that inorganic adsorbates may be an inexpensive first step in concentrating viruses. In any case we have to learn how to elute them!

By analogy ~~with immunofluorescence~~, I was wondering about amplify segments of DNA/RNA by transcription and using heteroduplex formation of segments for specific stains. Eventually get reagents by cloning segments:
