Many thanks, this is very useful, mainly in highlighting ignorance. I think we are going to have to look more closely at chronic lead toxicity for brain function; and the overhanging threat of remobilization of lead stored in bone.

Do look at the Law + Nelson article. It raises several interesting questions:

1. Lead psychosis
2. Gasoline psychosis.

Whatever we do about lead, we may have to denature* gasoline. (Or tax it like alcohol.)

or else completely detoxify it!
