Oct 31

Dear Beets:

We seem to have run across one of the "methyl-cholanthrene mutations" for microconidiation which seems not to be on chromosomes 1-4. I'm writing Sterling about his Sulfa gene, but could also use 33933 (lysine) as a 5-marker. Would appreciate it if it's in good shape still.

We enjoyed your visit very much indeed — Pep talks are now in progress here — much more in order than there!

Regards to all —
Yours Ed
