Personal memo from
JOSHUA LEDERBERG

RICK SMALLEY

OCT 21 1991

SERIOUS speculation: $C_{x+y} \to C_x + C_y$.

I should apologize for pestering you with trivia born out of enthusiasm.

Please look at this differently.

The "embryos" of Fig 170 enclosed are the exact analogues of the Dufay grains: we all know that.

But are they fissile? If so that might be the key to breaking out of the impasse, how to generate enough nuclei to account for the cosmic condensation.

Perhaps you get rearrangements: $C(x+y+60) \to C_{60} + C_x + C_y$, the lower energy of C_{60} driving the reaction.

Please let me know what you think?

Joshua
