P.S. other aldehydes: CH_3CHO

It seems to me that it would be most illuminating to have similar data on acetaldehyde — even more than formaldehyde a natural intermediate — for perspective on how close to zero exposures one should strive.

I chide myself for never having tested Acet myself in 1951, though it was on my mind. Nor have I located any data on muta- or carcino-genicity. It would of course be particularly germane to the assessment of ethanol as well as of formaldehyde.
