

March 8, 1948.

Dear Ed,

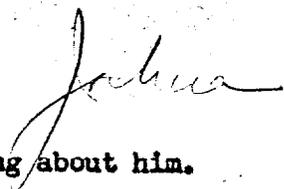

On February 13, 1947, I crossed Y-41 (~~58-163-V₁^r~~) with the following and recovered no prototrophs:
679-

58- 3214, 6177, 3232, 6049, 6317, 5450, 5255, which, since these stocks recombined with 679-662 to give prototrophs, suggests that they are all recurrences of mutations at the same locus. I have similar syntrophism data.

This is about the only series of tests that were made. I did not do many of the methionine series, and none of the other requirements recurred to any extent. I don't think any of the other work was done completely enough to be worth tabulating or referring to, unless you have something specific in mind. I'll talk to you about it next month. Of course you can refer to ^{the above} ~~it~~, as T&L unpub, if you like, since it was done at OEL.

Please send one cop. of the thesis presto. I have to study it, you know.

Best regards,

P.S. Tell Dave ~~Spock~~ that Barbara Wright was asking about him.

P.S.II I have some B₁- thiazole add -pyrimidine, which, as I recall you were out of. Interested?
