Dear Josh,

The students in my genetics course do special lab. problems during the last third of the term. One of them could be the induction of mutations in coli with UV, and then a determination of the kind of mutants induced. Since it is possible that they will get no mutants, I thought that it might be wise to have a few in stock so that they might be given "unknowns" to work out. Would it be possible to get some amino acid and vitamin requiring mutants from you?

Chlamydomonas is turning out to be an exciting organism for a number of interesting problems, and I hope to have some stuff on the cation story as well as some other information on recombination.

Best regards to you both,

Sincerely,
Paul Levine
