Dear Josh:

One of our technicians made up a threonine solution at 0.1% instead of 1%, and that explains the strange results on the control $B_1^+ P^+$ series. Another complication this week was the fact, discovered today, that 2 independent ~~$S^r I_a^r$~~ $S^r I_a^r$ strains both have relatively low recombination frequencies ($\frac{1}{10}$ or less). There probably won't be much to report for 2 weeks.

Gordon
