5) β + glucose	++		+++

The Lac- W-30.

Nov. 6, 1947.

W-30 represents a series of Lac- colonies which constituted 50% of the colonies found upon spreading mustard-treated 58-161 on Lactose EMB. 12 colonies derived from the untreated inoculum were all Lac+. The inoculum was derived from a single large colony (3 R) of a type constituting about 1/4 the colonies formed on a galactose-N2 dennis B-EMB plate (see. Expt. 7) In Expt. 10, the ratio of Lac+ : Lac- was:

	+	-	
plate 1.	18	10	
plate 2.	10	4	
plate 3.	8	6	
plate 4	12	16	
	48	36	/ 84.

A large fraction of both these types was found on each of the 70 plates of the experiment. (10)

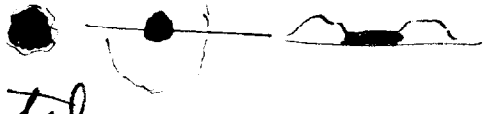
A). Pick 5 colonies from plate Expt. 7 in attempt to reproduce the expt.

B) Pick + streak out 5 Lac+ colonies from Expt. 10 to determine stability of these Lac+ : all plates show all Lac+ ~~-~~ !

c) Set up selection Expts. between these Lac+ and Lac- in broth.

On the Lac plates, W-30 forms broad flat colonies. These seem to engulf Lac+ colonies which they may contact.

On maltose two colony types are seen. Initially, they differ only in that some are less intensely colored on EMB than the others. Later they develop large beads of gummy material which projects from the surface.



On galactose no peculiarities had been noted.

C. Selection Expt.

A. Broc Lac+ colonies 2P6 into YP broth 25 ml.

B. Do. + 1 loopful of Lac- (W30) suspension.

Streak out duplicate Lac plates for initial assay.

A: all colonies Lac+ (Lac- < 1/100)
B: ditto.

		P7.	
C. Streak out	A	A 6: all+	all+
D.	B	A 6.: all+	all+.
		A10	
A2	Streak out P7.	all+	all+
B2	" " .	all+	all+

The combination: W-30 and the population of Lac+ from on these plates does not seem to satisfy selective hypotheses. The Lac+ may be resistant to the (hypothetical) inhibition. 58-161 (18-A) should be used instead.

D. Selection Expt. 11/10/47. Mix 1 ml broth culture of 18A1 with .05 ml similar suspension of W-30 from s Lamb in YP broth. Streak out initially, etc.

			A 11
