Jorh: MORSE 11/29/56

I find I have a culture of W3055 which is 2915(h) but I have no indicator for λh (W3140?). May be it would be a good idea if along with studying $\frac{2^- \; 4^+}{2 \; 4^-}$ R S I should ~~[illegible]~~ throw in h as a marker. For this purpose I'd need an indicator which you send along with 1210. I find in looking through my notes that 2281 (= 1210 lp⁰) has given a goodly no. of lp⁰s transduct. with LFT. These results are just the early data and may be due also to "old lysates". To check this, and to see if the lp⁰'s from 1210 are so this is an important step – to find out if all lp⁰ are the same. I believe Esther noted this also, and she may have forgotten it too. I'm summarizing LFT × lp⁰ data and will send along shortly.

Larry.
