OFFICE OF THE PRESIDENT

Tues, 4 Aug.

Dear Josh;

I knew nothing of this journal until discovering it on the shelf in the library. So I've overlooked this interesting paper which summarizes the flower pigment work. I've included only part of the paper. The rest was taken up with reminiscences of people at the John Innes lab.

She mentions Garrod & says that his observations fit "into our picture" (p 154), ~~but~~ not the other way around. I guess biochemical genetics is another one of Merton's independent discovery cases.

The publication of Garrod's Inborn Factors in Disease is still in the future. I'm not being unkind in saying that I finished my part of it last summer, but Scriver, the busy man, is doing his this summer.

All the best,

Y.

Barton
