BrOH etc.

Thank you for clearing up the temperature interaction in toxicity: of interest in its own right.

How do your Br-PrOH mutants relate to chloroacetaldehyde? Are those mutants hydrogenase deficient? to chloroacetate as an inhibitor? I scribbled a note to you about that in January.

BrOH-dependence!! The only remote analog that comes to me is streptomycin-dependence — and no explanation emerges from that!

At first blush, one thinks of membranes as site of toxicity and dependence. Is BrOH specifically incorporated?

Thank you for mister. When I lived in Madrid I used to visit Carl Lindegren. Doubt that I can get away this year.
