Dear Francis

My return here was delayed for over a week due to a persistent flu which did not disappear. Hence my failure to return via England. I most appreciated your comments on my book, most of which I assume your memory is more correct. On several I'm not sure - (e.g. Odile certainly did the decorations. On the other hand, the fact that most of the dancers would be black was certainly an inducement that it might be fun.) In several cases, I'm sure I'm right. E.g. Bragg himself told me that he avoided the tearoom for fear of hearing your voice. Now I suspect I need about one month of steady work to make the corrections - much rewriting of the first 9 chapters - Doing this in Geneva seems silly so I shall probably put off the task until mid summer.

We sent a copy of Capyechi's new end group data to Marcher - it

definitely establishes that the following NH_2 terminal sequences exist

f-meth-ala-...

f-meth-ser very little if any f-meth-meth exists

given Wallis cro group data I suspect in time

f-meth-thr

will be found. This strikes me as not clear that the beginning sequences

may be

AUG GC... f-meth-ala.

AUG UC f-meth-ser

AUG AC f-meth-thr

Trust Odile is now completely recovered.

could this be a way

to control the rate at which

RNA polymerase attacks to action

operons?

see you in CSH

J.
