July 28th

A batch of cultures and phages have just arrived from Vhatta, mostly groups E. & E2.

Two of the phage vials were empty on arrival, vials 547 and EE-27. Two others were rather dark but the vials were opened but not empty (EE-17 or EE-27). The two remaining phages in the culture look ok.

I'll take the lab to its state.

I thought you might like to mention the phages of the culture seen for about 5 vials.
