EPOXIDE HYDROLYSIS

This is probably familiar to you. But it just occurred to me that the differential induction of PSC & accompanying hydrolysis could cause the most troublesome accumulation of intermediates. Assume that the dies are relatively innocuous compared to the epoxidases, but do not bear empirical validation.

Have you measured induction of hydrolysis in your case?

P.S. - Please think who would be a good connect to Dr. A.J. O'Malley.
