

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON 25, D. C.

August 8, 1955

Dear Professor Lederberg:

Thank you for your letter of August 4 and its enclosure (part of a draft of your paper to be published in a Growth Society Symposium). My connection with the Atomic Energy Commission certainly slows down all my other activities, but I hope I will succeed in not abandoning the one to which you refer.

In connection with the draft that you sent me, I would like to make the following comment. On page B-11, lines 9-12, you say that my model depends for its self-reproduction on "the correct array of organized parts (the information already inherent in which perhaps begs the question of biological reproduction)." I cannot agree to this, that is, to the bracketed clause in your sentence. I showed this. In the fixed medium M (independent of the A that follows), given any aggregate A (outside M), it is possible to specify an aggregate A^1 (also outside M, and dependent on A), such, that if A^1 is immersed into M, it will keep reproducing A^1 and producing A. Now: since M is independent of A, the information-content of A cannot be contained in M; since A^1 can produce A, the information-content of A must be contained in A^1 ; hence the information-content of A^1 (A^1 is self-reproductive!) cannot be contained in M.

Does this argumentation satisfy you?

I am,

Yours sincerely,

Encl.

John von Neumann

Professor Joshua Lederberg
Department of Genetics, College of Agriculture
University of Wisconsin
Madison 6, Wisconsin

P.S. - I assume that you will wish me to return your typescript; I am, therefore, enclosing it.

VON NEUMANN, J.
