P.S. Other aldehydes. Ethedehyde.

It occurs to me that it would be most illuminating to have similar data on acetaldehyde—ever more than formaldehyde, a natural intermediate—in perspective on how close to zero exposures one should strive.

I think myself in some having tested acetone in 1957, though it was not my mind. Nor have I looked any data on muta—er cancer sensitivity. It would of course be particularly germane to the assessment of ethanal as well as of formaldehyde.
