Dear Dr. Gregg,

I am hoping to spend some 10 weeks in the Eastern States next spring - from Jan 25 - looking they in the different laboratories - hospitals.

Dr. Williams told me before I came away that you are going to Europe in February - but I hope it may be possible for you for a few minutes.

Tell me how are we and you at Queen Charlotte's Hospital.

I expect that a New York Jan 25 - 31 will be
from Feb 22 to March 4th, perhaps, a few days later.

Is there any chance of catching you between these dates?

I am glad to say that my work with the streptococcus has developed well and is satisfactory.
letter surprising—say, since I saw you 2 years ago.

On the preventive side, it has converged with
that of Dr. Lancefield, Phoenix Wright, of the Rockefeller
Institute to certain definite conclusions so that
he is now able, I think, to help the clinical people
a well-established basis for their preventive measures.

And during the last year were important progress
has come along with means of treatment which
promises to have very widespread effects in
medicine, surgery as well as in obstetrics.

The first steps in the chemotherapy have come from
Germany, but I am glad they that the little Unit
at Queen Charlotte's
which I have helped to come into being has been able
to play its part in developing it.

It is now already more attention in the States & I
have been asked to tell about it in Philadelphia, Baltimore,
Cleveland & so forth. I propose next time to tell a General
Survey of our work & I hope they may be useful.

Best kind regards.

Yours sincerely, Leonard Edelwex
P.S.

I ought to have explained this address. The Medical Research Council has given me 2 months leave on holiday because I felt overworked, very heavy headaches, with insomnia. (The pace has been rather hot this last year.) Happily I am now in splendid condition and sleeping well.
